

DID YOU KNOW ??...

Lead Contaminants If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. We are responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 15 to 30 seconds or until it becomes cold or reaches a steady temperature before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>

Lead and Copper Inventory Information

Rockingham County completed the initial lead and copper service line inventory in 2024 as required by the EPA. This inventory included the water service line material type for both the system and the public side. If the material was unable to be identified, the status was left as unknown, until further identification can be made. To access a copy of the service line inventory please contact Public Works at 540-564-3020 or visit the Public Works Office at 20 E Gay Street Harrisonburg, Virginia 22802. Exposure to lead in drinking water can cause serious health effects in all age groups. Infants and children can have decreases in IQ and attention span. Lead exposure can lead to new learning and behavior problems or exacerbate existing learning and behavior problems. The children of women who are exposed to lead before or during pregnancy can have increased risk of these adverse health effects. Adults can have increased risks of heart disease, high blood pressure, kidney or nervous system problems.

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and can pick up substances resulting from the presence of animal activity, including human. Contaminants that may be present in source water include: (1) Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; (2) Inorganic contaminants, such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming; (3) Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses; (4) Organic chemical contaminants, including synthetic and volatile organic chemicals and pharmaceuticals, which are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, sewage treatment plants and septic systems; (5) Radioactive contaminants, which can be naturally-occurring or be the result of oil and gas production and mining activities. To ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

All drinking water, including bottled drinking water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline (800-426-4791).

A WATER QUALITY REPORT FOR THE WATER USERS OF Countryside Sanitary District Water System PWSID # 2165180

In compliance with the Safe Drinking Water Act and as a service to our water users, Rockingham County presents this report, which summarizes our efforts to provide our water users with safe drinking water. This report covers the period from January 1, 2024, to December 31, 2024.

The quality of your drinking water meets all state and federal requirements administered by the Virginia Department of Health (VDH), Office of Drinking Water.

In order for you to get the most from this report we are providing the following list of terms and definitions:

ppb-parts per billion
mg/L– milligrams per Liter
ND-not detected

Nephelometric Turbidity Unit (NTU) – nephelometric turbidity unit is a measure of the clarity of water. Turbidity in excess of 5 NTU is just noticeable to the average person.

Picocuries per liter (pCi/L) - picocuries per liter is a measure of the radioactivity in water.

Treatment Technique (TT) - a required process intended to reduce the level of a contaminant in drinking water.

Action Level (AL) - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Our Water Source

The source of your drinking water is obtained from the Town of Bridgewater whose sources consist of a groundwater source in Bridgewater and a surface water source at North River.

Source Water Assessment

A Source Water Assessment was performed by the State to determine the water system's susceptibility to contaminants in 2002. It was determined that our wells have a high susceptibility due to being under the direct influence of surface water at North River and groundwater from Schofield Well.

Treatment

Raw water is disinfected using chlorine and filtered and fluoridated.

Microbial Contaminants

Our water system performs monthly bacteriological monitoring to test for the presence of coliform bacteria, fecal coliform and E.coli. We are required to do 1 bacteriological sample per month. Our sampling has detected no coliform or fecal coliform positive results in the past twelve months.

Lead and Copper Monitoring

Date Last Sampled for Lead:	August 2022
90 th Percentile for Lead:	ND
Violation:	No
Sampling Results Range	All 5 samples <2ppb
Number of Sites Exceeding Lead Action Level:	0 out of 5

The action level for lead is 15 ppb.

Date Last Sampled for Copper:	August 2022
90 th Percentile for Copper:	0.116 mg/L
Violation:	No
Sampling Results Range	25ppb-117ppb
Number of Sites Exceeding Lead Action Level:	0 out of 5

The action level for copper is 1.3 mg/L.

Chemical Monitoring

Metals

Required Sampling Frequency: Once every year
 Date Last Sampled: October 2024 Barium 0.036 ppm
 Likely source- Discharge of drilling wastes; discharge from metal refineries; Erosion from natural deposits.

Haloacetic Acids (HAA5)

Date Last Sampled: August 2024
 23 ppb No violation
 Likely source- By-product of drinking water chlorination

Total Trihalomethanes (TTHM)

Date Last Sampled: August 2024
 74 ppb No Violation
 Likely source- By-product of drinking water chlorination

Radionuclides

Last Date Sampled: April 2020
 Required Sampling Frequency: Once every six years
 Result: Gross Alpha: 2.8 pCi/L No Violation
 Result: Gross Beta: 3.0 pCi/L No Violation
 Result: Combined Radium: 162 pCi/L No Violation

Total Organic Carbon (TOC)

Sampled Monthly 2024
 Range ND-.86
 Likely source- Naturally present in the environment.

Sodium 5.04 mg/L No Violation

Chlorine

0.51 mg/L-1.71 mg/L Daily 2024 No Violations

Other Results

Turbidity max. Likely source- Soil Runoff TT= 0.3 NTU	Daily 2024	No violation All samples were < 0.07 NTU 100 % of the time.
Fluoride Likely source- Water additive, Erosion of natural deposits	0.49-0.64 mg/L Range Monthly 2024	No violation
Nitrates Likely source- Fertilizer runoff, Leaching from septic tanks, seawater, erosion of natural deposits	1.61 mg/L Sample November 2024	No violation

Water from surface sources is treated to make it drinkable while groundwater may or may not have any treatment. Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

General Information

The Board of Supervisors normally meet every month on the second Wednesday at 3:00 pm and the fourth Wednesday at 6:00 pm. in the Board of Supervisors' Meeting Room located in the Rockingham County Administration Center, 20 E Gay St, Harrisonburg, VA.
